UNIVERSITY OF COLOMBO SCHOOL OF COMPUTING

DEGREE OF BACHELOR OF INFORMATION TECHNOLOGY

Academic Year 2012/2013 – 2<sup>nd</sup> Year Examination – Semester 4

***IT4104: Programming II***  
***Part 1: Multiple Choice Question Paper***

20<sup>st</sup> July, 2013  
(ONE HOUR)

**Important Instructions :**

- The duration of the paper is **1 (one) hour**.
- The medium of instruction and questions is English.
- The paper has **25 questions** and **7 pages**.
- All questions are of the MCQ (Multiple Choice Questions) type.
- All questions should be answered.
- Each question will have 5 (five) choices with **one or more** correct answers.
- All questions will carry equal marks.
- There will be a penalty for incorrect responses to discourage guessing.
- The mark given for a question will vary from 0 (*All the incorrect choices are marked & no correct choices are marked*) to +1 (*All the correct choices are marked & no incorrect choices are marked*).
- Answers should be marked on the special answer sheet provided.
- Note that questions appear on both sides of the paper.  
If a page is not printed, please inform the supervisor immediately.
- Mark the correct choices on the question paper first and then transfer them to the given answer sheet which will be machine marked. **Please completely read and follow the instructions given on the other side of the answer sheet before you shade your correct choices.**

- 1) Consider the following table having two columns. In **Column I** different searching techniques are written. In **Column 2** some big O notations are shown. Entries in the **Column 1** are not written to match entries in **Column 2**.

| Column 1 |            | Column 2 |            |
|----------|------------|----------|------------|
| A        | Binary     | I        | $O(n)$     |
| B        | Hashing    | II       | $O(\lg n)$ |
| C        | Sequential | III      | $O(1)$     |

Match each entry from **Column I** with the most appropriate entry in **Column 2**.

- |  |  |  |
|--|--|--|
| (a) $A \rightarrow I, B \rightarrow II, C \rightarrow III$ | (b) $A \rightarrow III, B \rightarrow II, C \rightarrow I$ | (c) $A \rightarrow III, B \rightarrow I, C \rightarrow II$ |
| (d) $A \rightarrow I, B \rightarrow III, C \rightarrow II$ | (e) $A \rightarrow II, B \rightarrow I, C \rightarrow III$ |  |

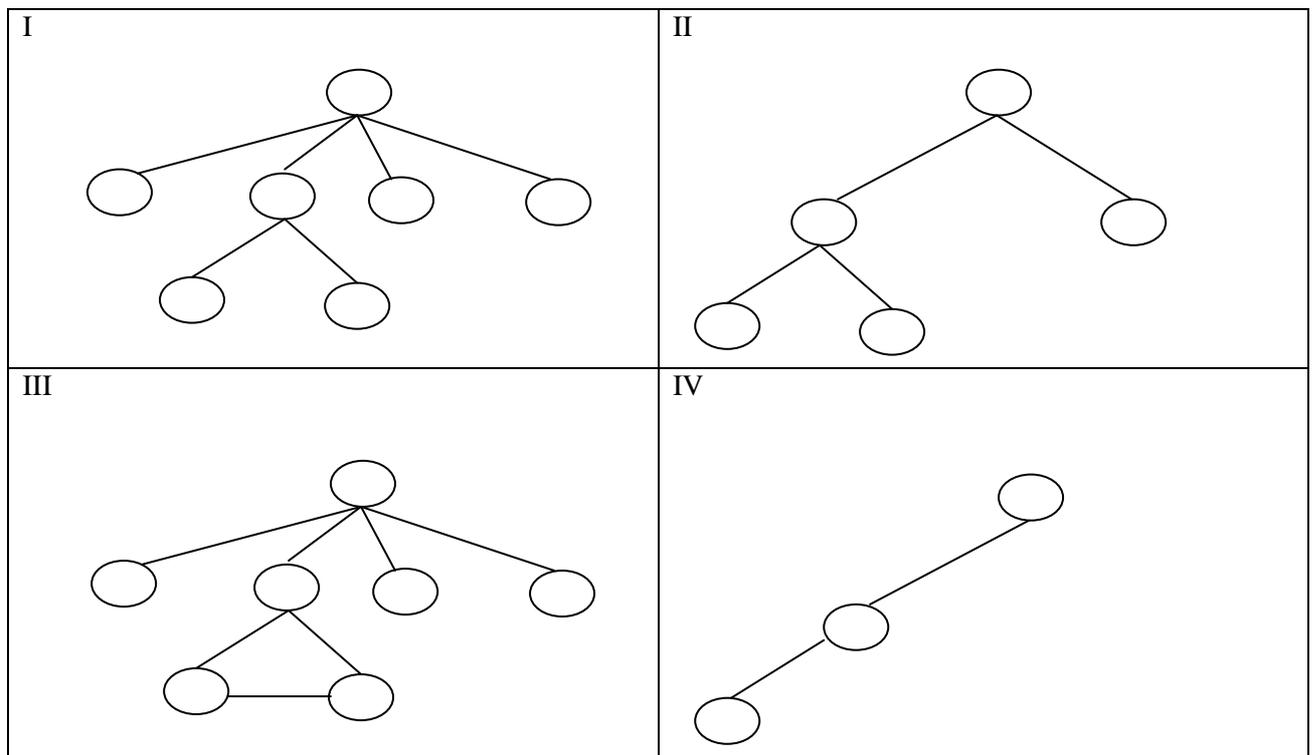

- 2) Consider the following paragraph.

“In searching a value it is necessary to have a key to locate the value. As a different approach to searching, one can calculate the position or key of the index to store a particular value based on that value.”

Select from among the following, (a) valid name/s that can be used for the process mentioned.

- |             |                |             |
|-------------|----------------|-------------|
| (a) Hashing | (b) Traversing | (c) Folding |
| (d) Sorting | (e) Addressing |             |

- 3) Consider the following diagrams which are numbered from I to IV.

Select from among the following, valid options that can be considered as Trees.

- |                        |                         |                         |
|------------------------|-------------------------|-------------------------|
| (a) I only.            | (b) I, II and III only. | (c) I, III and IV only. |
| (d) I, II and IV only. | (e) III only.           |                         |

Consider the following program written in Java to answer question 4 – 5.

```
public class WhatCalculator {  
    public static void main(String args[]) {  
        int number = 4;  
        System.out.print(what(number));  
    }  
  
    public static int what(int number){  
        if(number < 2)  
            return 1;  
        else  
            return what(number-2) + what(number -1);  
    }  
}
```

4) What would the output of the program be?

- |             |           |       |
|-------------|-----------|-------|
| (a) 3       | (b) 4     | (c) 5 |
| (d) 3 2 1 1 | (e) error |       |

5) Select from among the following, the programming concept/s which has (have) been used in the program.

- |                          |                  |                 |
|--------------------------|------------------|-----------------|
| (a) Multiple inheritance | (b) Polymorphism | (c) Inheritance |
| (d) Recursion            | (e) Data hiding  |                 |

6) Consider the following two properties which are describing a special type of a data structure.

- I. The value of each node of the data structure is less than or equal to the values stored in each of its children.
- II. The data structure is perfectly balanced and the leaves in the last level are all in the left most positions.

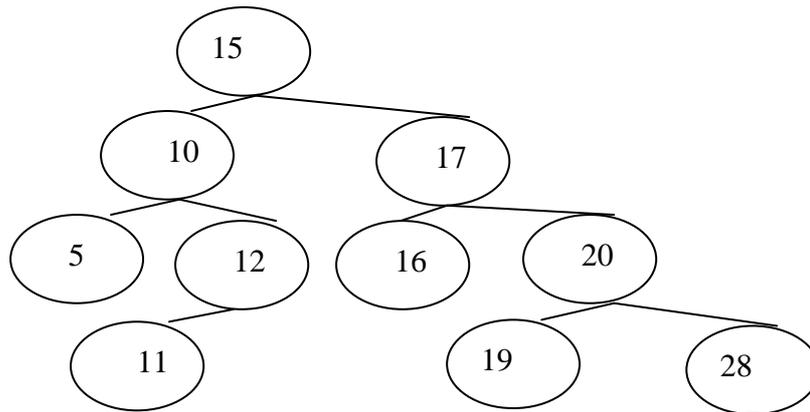

Select from among the following, a valid name which can be given to identify the special type of tree.

- |                           |                    |                    |
|---------------------------|--------------------|--------------------|
| (a) Min heap              | (b) Priority queue | (c) Tail Recursion |
| (d) Depth first traversal | (e) stack          |                    |

7) Select from among the following, the way/s one can implement a binary tree.

- |              |                      |             |
|--------------|----------------------|-------------|
| (a) an array | (b) a linked list    | (c) a queue |
| (d) a graph  | (e) a selection sort |             |

Consider the following tree data structure illustration to answer questions 8 to 13.

8) Select from among the following, the name which can be given for the node having the key 15.

- |            |          |          |
|------------|----------|----------|
| (a) graph  | (b) node | (c) root |
| (d) vertex | (e) arc  |          |

9) Select from among the following, the number of leaf nodes in the tree.

- |       |       |       |
|-------|-------|-------|
| (a) 6 | (b) 5 | (c) 4 |
| (d) 3 | (e) 2 |       |

10) Select from among the following, the size of the tree.

- |       |        |       |
|-------|--------|-------|
| (a) 9 | (b) 10 | (c) 8 |
| (d) 7 | (e) 6  |       |

11) Select from among the following, the height of the given tree.

- |       |       |       |
|-------|-------|-------|
| (a) 1 | (b) 2 | (c) 3 |
| (d) 4 | (e) 5 |       |

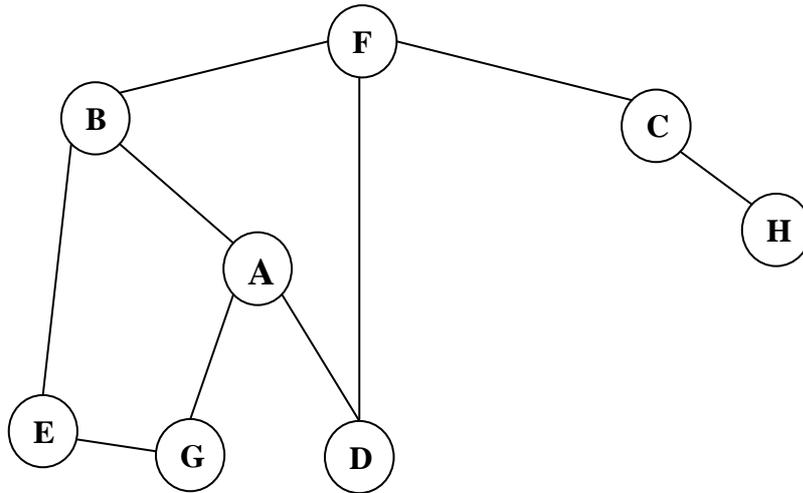

12) Select from among the following, the internal node/s that can be seen in the tree.

- |        |        |       |
|--------|--------|-------|
| (a) 15 | (b) 10 | (c) 5 |
| (d) 12 | (e) 11 |       |

13) Select from among the following, the ancestor/s of the node 16.

- |        |        |        |
|--------|--------|--------|
| (a) 15 | (b) 10 | (c) 12 |
| (d) 16 | (e) 17 |        |

Consider the following Graph illustration to answer the questions 14 and 15.

14) After applying a Graph traversal technique, the following result has been identified.

**ABEGFCHD**

Select from among the following, the Graph traversal technique that has been applied to obtain the above result.

- |                 |                   |                |
|-----------------|-------------------|----------------|
| (a) Depth-first | (b) Pre order     | (c) Post order |
| (d) In order    | (e) Breadth-first |                |

15) One has applied another Graph traversal technique and obtained the following result.

**ABDGEFCH**

Select from among the following, the Graph traversal technique that has been applied to obtain the above result.

- |                 |                   |                |
|-----------------|-------------------|----------------|
| (a) Depth-first | (b) Pre order     | (c) Post order |
| (d) In order    | (e) Breadth-first |                |

16) Consider the following pseudo code of a popular algorithm related to a Graph data structure.

```

whatMethod(weighted connected undirected graph)
  tree = null;
  edges = an unsorted sequence of all edges of graph;
  for j = 1 to | E |
    add ej to tree;
    if there is a cycle in tree
      remove an edge with maximum weight from this only cycle;
  
```

Select from among the following, the purpose of the algorithm.

- |  |                                 |
|--|---------------------------------|
| (a) Inserting a node                     | (b) Identifying a Spanning tree |
| (c) Identifying a shortest path          | (d) Creating a directed graph   |
| (e) Implementing the Kruskal's algorithm |                                 |

Consider the following declarations and initializations of variables to answer questions 17 to 23.

```
private int maxSize;  
private long[] ex1Array;  
private int top;
```

```
private int maxSize;  
private long[] ex2Array;  
private int front;  
private int rear;  
private int nItems;
```

And then consider the following names of a few data structures and their identifiers.

- I Stack
- II Queue
- III Tree
- IV Graph

Each question 17 to 23 is given a segment of code representing a function of a particular data structure as a method, written in Java. Method name is represented as a **blank**. Identify the functionality and then the name of that method to fill in the **blank** along with the identifier of the data structure as indicated in the above list.

E.g.

Method Name → identifier of the data structure (assuming the data structure is a Queue)

pop → II

17) public void **blank**(long j)  
{ ex1Array[++top] = j; }

- |                  |                  |
|------------------|------------------|
| (a) push → I     | (b) delete → III |
| (c) enqueue → II | (d) pop → I      |
| (e) pop → IV     |                  |

18) public long **blank**()  
{ return ex1Array[top--]; }

- |                  |                  |
|------------------|------------------|
| (a) push → I     | (b) delete → III |
| (c) enqueue → II | (d) pop → I      |
| (e) pop → IV     |                  |

19) public long **blank**()  
{ return ex1Array[top]; }

- |                 |                  |              |
|-----------------|------------------|--------------|
| (a) peek → I    | (b) pop → III    | (c) push → I |
| (d) isEmpty → I | (e) dequeue → II |              |

20) public boolean **blank**()  
{ return (top == -1); }

- |                 |                  |              |
|-----------------|------------------|--------------|
| (a) peek → I    | (b) pop → III    | (c) push → I |
| (d) isEmpty → I | (e) dequeue → II |              |

21) `public void blank(long j) {  
 if(rear == maxSize-1)  
 rear = -1;  
 ex2Array[++rear] = j;  
 nItems++;  
}`

- |              |                  |                  |
|--------------|------------------|------------------|
| (a) push → I | (b) delete → III | (c) enqueue → II |
| (d) pop → I  | (e) pop → IV     |                  |

22) `public long blank()  
 {  
 long temp = ex2Array[front++];  
 if(front == maxSize)  
 front = 0;  
 nItems--;  
 return temp;  
}`

- |                 |                  |                 |
|-----------------|------------------|-----------------|
| (a) peek → I    | (b) pop → III    | (c) isFull → II |
| (d) isEmpty → I | (e) dequeue → II |                 |

23) `public boolean blank()  
 { return (nItems==maxSize); }`

- |                 |                  |                 |
|-----------------|------------------|-----------------|
| (a) peek → I    | (b) pop → III    | (c) isFull → II |
| (d) isEmpty → I | (e) dequeue → II |                 |

24) Select from among the following, what can be considered as sorting algorithms.

- |               |               |           |
|---------------|---------------|-----------|
| (a) insertion | (b) selection | (c) radix |
| (d) folding   | (e) division  |           |

25) Select from among the following, what can be considered as a label setting algorithm.

- |                                     |                          |                   |
|-------------------------------------|--------------------------|-------------------|
| (a) Dijkstra                        | (b) Selection            | (c) Spanning tree |
| (d) Stackless depth first traversal | (e) Breadth first search |                   |
